

Why should I use multiple Hydrawise weather stations in the portal?

If you have an Enthusiast Plan, we recommend that you select multiple weather stations around your Hydrawise controller's location. Your controller will use the median rainfall and temperature values from these weather stations to automatically adjust your watering schedule. Below is an example:

This example shows five weather stations have been selected surrounding the actual location of the controller. By doing this, you get predictive weather data regardless of which direction the weather changes come from.

If you have a Home Plan, you can only choose one airport weather station (shown in purple when you choose your weather stations). Multiple weather stations are not necessary on the Home Plan due to the reliability of airport stations.
