

# What alerts can I get from my flow meters?

If your water flow is higher or lower than previous watering cycles, our system can send app notifications or SMS alerts. The thresholds for the alerts are configurable as a percentage of the previous watering cycle.

For example, you can create an alert if the watering amount is 10% above the previous cycle, as this could indicate a broken spray head. Or you can create an alert if the watering amount is 90% less than the previous watering cycle, as this may indicate that the system is blocked or wiring is faulty.

You can also create an alert if water flow is detected when no irrigation zones are running. This may indicate that you have a broken pipe or stuck valve.

For more information, see [Configuring Sensors](#) [1] and [Understanding Flow Alerts and How They Work](#) [2].
