

Why is a flow meter useful?

Flow meters can be used to detect broken pipes, broken spray heads, faulty valves, or faulty wiring.

An undetected water leak can take months to notice and lead to expensive water bills.

Faulty wiring could mean that your garden isn't receiving the right amount of water, which can lead to dead plants and leave you with the cost of replacing them.

A flow meter also allows you to understand the amount of water applied to your garden, and gives you the ability to monitor your irrigation system remotely.
